2.1.2.3	Please provide a brief explanation of the trend in current smoking prevalence by age group in the past two years or since submission of your last report, if data are available.
	<p>The data show that the rate of tobacco use among males drastically increases when transiting from the 15-19 age group to that of 20-29. It may be concluded that tobacco use rates increase with the age not only because the teenager boys step into adulthood and come out of strict control of parents. There is a substantial difference in numbers between smoker men and women: there are age groups where the number of male smokers is ten times higher. The difference among smoker females in the capital city and the other marzes (Armenian provinces) is also substantial enough (almost five times higher as a whole). This allows us to suppose two things: one, that the number of female smokers in the capital city is much higher than in marzes (Armenian provinces), and two, it is quite probable that female smokers in provinces hide their habit of smoking due to some mental and traditional reasons.</p>

In the spring of 2014 the new survey GYTS is conducting at the moment the data will be available in the end of year.
